Step 1: Apply leveling mortar (Velosit RM 205) into the groove. The amount and width of the mortar depend on the profile. The mortar is used to achieve the desired height for the profile. Prepare the substrate according to the leveling mortar instructions.

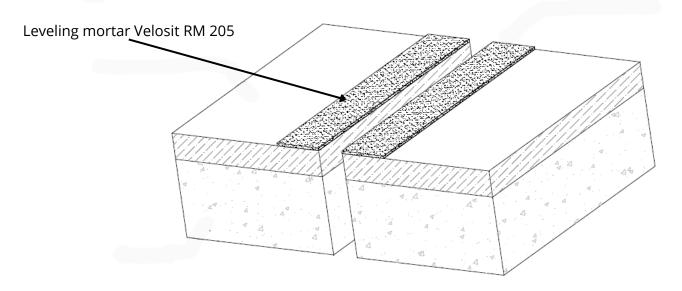

Figure 1. Installation of leveling mortar

Step 2: Install the profile into the "wet" leveling mortar. The profile should be at the desired finished level. It's important that there are no gaps between the bottom of the profile and the mortar.

Step 3: After the leveling mortar has dried, the profile is attached to the substrate using either concrete screws or wedge anchors M10x90. For this, holes are drilled into the substrate at 300 - 350 mm intervals. The profile has pre-made holes.

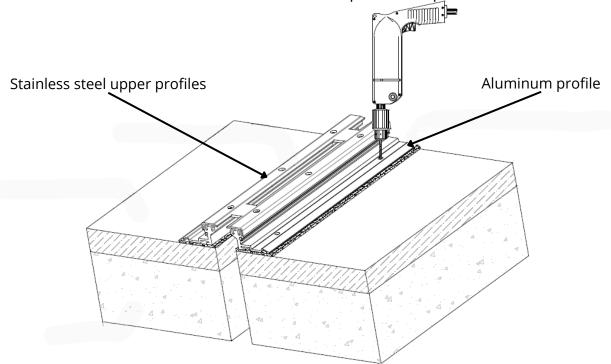

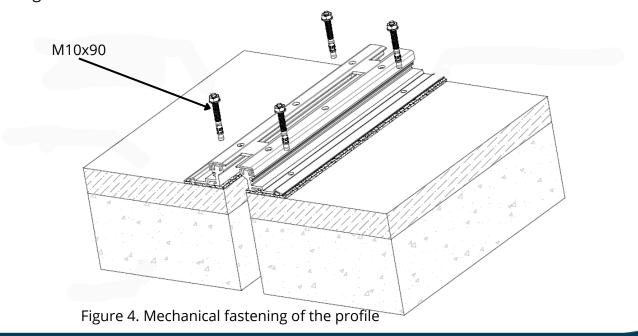

Figure 3. Drilling mounting holes into the substrate

Step 4: After drilling, the profile is fastened to the substrate with concrete screws or wedge anchors.

Step 5: The stainless steel upper profiles and installation clips should be removed once the profile is mechanically fastened to the substrate. KEEP THE UPPER PROFILES AND SCREWS.

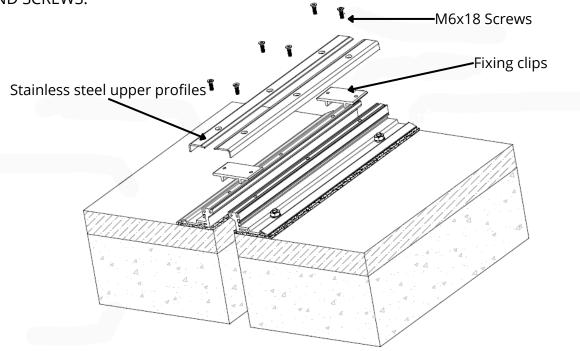

Figure 5. Removal of stainless steel upper profiles and installation clips

Step 6: Install the side rubbers in place. The most common model has short side rubbers. The model in the image has long side rubbers. The aluminum profile has compatible grooves for the side rubbers. THE RUBBERS CAN BE CUT TO FIT THE

Step 8: Reinstall the previously removed stainless steel upper strips to secure the rubber attachment. The upper strips are fastened with the same screws as they were originally attached (M6).

Step 9: Fill the groove with Velosit RM 205 mortar to the level of the floor and profile. Leave a thin gap at the edge of the profile for sealing.
